Abstract: This paper investigated impacts of human resource management on financial performance of Vietnam Joint Stock Commercial Bank for Industry and Trade (VietinBank). The study employs both qualitative and quantitative methods for analysis. The data is collected from 250 employees working at different branches of VietinBank in Vietnam. The study uses SPSS software to test research hypotheses via measurement scales, descriptive analysis, EFA analysis, correlation coefficients, and linear regression model. The results show that these 7 factors: selection, training, job description, performance appraisal, compensation system, career planning, employee participation have significant impacts on the financial performance of VietinBank.

Keywords: Human resources, financial performance, scales, hypotheses, training.

INTRODUCTION

Banking industry has played an important role in supporting national as well as global economic growth. In Vietnam, the banking system, at the discretion of the government, has helped the country achieve its goal of growth, macroeconomic stability, and inflation control by flexible utilization of different monetary policy tools during tough economic times. In particular, from mid-2012 up to now, the macroeconomy of Vietnam has been gradually stabilized with a steady decrease of Consumer Price Index (CPI) towards the control level. However, in early years of the period, the economic growth encountered many obstacles such as decreased demand, high inventories, and slow economic growth. At that moment the banking industry prioritized developing and immensely implementing flexible solutions to support the growth of the economy. Noticeably, interest rates have been reduced to increase firm's access to capital sources. In addition, a series of credit programs and policies, which contribute to the economic development and social security have been effectively operated.

Up to now, the system of commercial banks in Vietnam has developed on a large scale, and become a key source of capital in the economy. By 2015, the commercial banking sector accounted for a very large proportion with total assets of 75% out of those in the whole financial

system, in which, its total outstanding credit was up to 4,656 trillion VND, equal to 111% of GDP. With such a large scale, bank credits are considered as the main capital source of the economy, accounting for 40-45% of the total investment capital.

In the overall success of the industry, state-owned commercial banks have performed a key role in leading the whole sector in implementing the policies of the Government and the industry. By the end of 2015, the state-owned commercial banks sector consist of 4 banks (Agribank, BIDV, Vietinbank, Vietcombank) accounting for 45% of total assets, 50.2% of total outstanding loans and 46.3% of mobilized capital of the whole system. Over the period of 2011-2015, state-owned banks made a major contribution to the growth with an average growth rate of total assets at 13.8% per year, higher than that of the whole system at 10.3% per year, and particularly the credit grew at 17.1% per year compared to 13.5% per year of the banking industry.

Vietnam Joint Stock Commercial Bank for Industry and Trade (VietinBank) was established in 1988 and it is a state-owned commercial bank. The bank has a wide network of 155 branches, 09 member companies, 03 non-business units and more than 1,000 transaction offices in 63 provinces/cities nationwide. Also, Vietinbank is the first and only the bank, which has branches in

Europe: two branches in Frankfurt and Berlin - Germany. At the same time, Vietinbank has been present in Vientiane – Laos, and is actively promoting the opening of representative offices and branches in many other countries such as Myanmar, England, Poland, Czech Republic, etc. Therefore, human resource management must be taken into account as an essential part of the bank's operational management. Given that insight, this paper is conducted to evaluate how human resource management has affected financial performance of VietinBank.

LITERATURE REVIEW

Human resources are defined as people within organizations, which should be studied in discrete aspects. In the narrow sense, they involve groups of working-age population with full physical and mental working capacity, thus equivalent to labor sources. In the broad sense, they involve those who are full 15 years of age or older. Human resources are generally considered in two dimensions, quantity and quality, so human resource development is related to both of them. However, at present, nationally and globally, the quality of human resources is the top concern so it is the main focus of human resource development activities. Human resource development is the process of improving the quality and efficiency of exploiting human resources.

Morrison (1996) proposed a model of human resource management (HRM) that included 6 components: (1) Philosophy of HRM; (2) Recruitment; (3) Job Description; (4) Socialization; (5) Training; (6) Assessment and Rewards. In particular, the Philosophy of HRM is a system of policies, points of view, assessments as well as beliefs of administrators about their employees; Socialization means that employees are empowered to participate in the planning and decision making process of their organization's general activities.

Guest (1997) proposed a model of HRM consisting of 7 components: (1) Selection; (2) Training; (3) Appraisal; (4) Rewards; (5) Job Design; (6) Involvement; (7) Status and Security. According to Pfeffer (1998), there were 7 components in HRM: (1) Ensuring job security; (2) Recruiting new employees; (3) Building autonomous and decentralized teams in decision making; (4) Setting high salary in relation to results; (5) Expanding training; (6) Reducing position gaps and barriers such as pay gap; (7) Encouraging to share information and financial results within the organization.

According to the research model of Marwat and Tahir (2011) on HRM and employee performance, HRM include 07 components: Selection; Training; Performance Appraisal; Career Planning; Compensation; Employee Participation; Job description.

Qureshi *et al.*, (2007) surveyed the impacts of factors: selection, training, performance appraisal system, compensation system, and employee participation on organizational performance. The results showed that among these factors, only the selection, training, and employee participation factors had positive impacts on organizational performance. Consistent with these findings, Singh (2004) found that there was a positive relationship between several human resource management such as recruitment, performance evaluation, training, and compensation system and employee engagement with company performance. Among these factors, only training and compensation systems have a positive impact on performance of the company and its market. Also, Wan *et al.*, (2002) examined the relationship between HRM and organizational performance. The former have created a positive effect on the later. Calculation results through a regression method suggested that effective implementation of key HRM enhance organizational performance. On the other hand, companies concerned about improving employees' performance should stress the need for empowerment and training.

According to Qureshi *et al.*, (2010), 7 factors of human resource management have affects on financial performance of banks including selection, training, job description, performance appraisal, compensation system, job planning, and employee engagement.

RESEARCH MODEL

This study identifies different elements of human resource management that affect the financial performance of Vietnam Joint Stock Commercial Bank for Industry and Trade (Vietinbank). Based on the model of Qureshi *et al.*, (2010), the research paper has selected the following factors: selection, training, job description, performance appraisal, compensation system, job planning, and employee participation. The expected signs of coefficients or the directions of impacts are also shown in the proposed model in Figure 1.

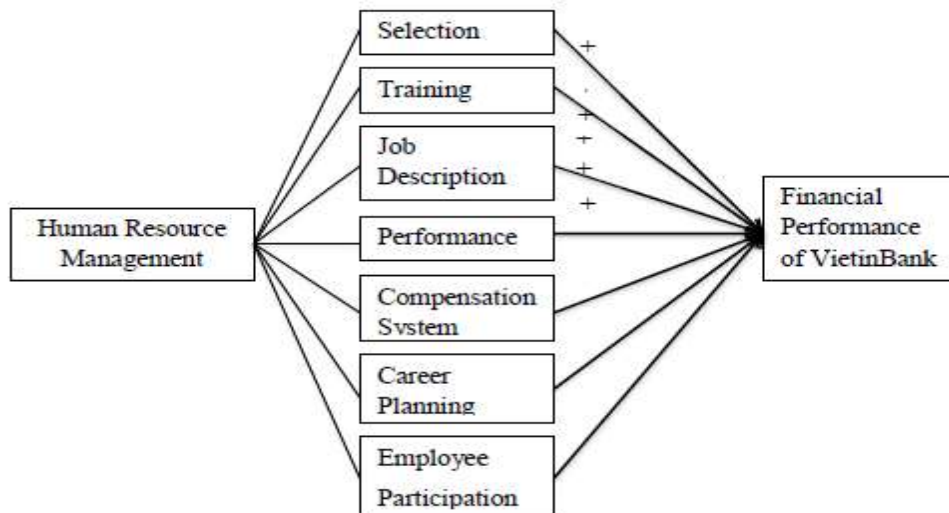

Figure 1: Proposed research model

METHODOLOGY

The quantitative method employs the interview techniques by emails and questionnaires. The sample of 250 employees is randomly selected in VietinBank’s system. The collected data is processed by the software SPSS 20, then Cronbach’s Alpha test will be used for assessments on the reliability of scales, also Barlett and KMO tests are adopted for exploring factor analysis (EFA). Meanwhile, regression analysis will be used to measure the impacts of human resource management.

RESEARCH RESULTS

Cronbach’s Alpha analysis

After the first Cronbach’s Alpha analysis, the results show that Cronbach’s Alpha equal to 0.588. However, the correlation value of the total variable of FP4 and FP5 are -0,116; 0.060 less than 0.3 (invalid for the reliability analysis). Therefore, the author removes the FP4 and FP5 variables of the Financial Performance factor and performs the second reliability test. After that, the researcher obtains a Cronbach’s Alpha coefficient of 0.817 (greater than 0.6, valid for the reliability analysis) and all correlation coefficients of variables are greater than 0.3. Therefore, the variables FP1, FP2, FP3 which belong to the Financial Performance group are suitable to be included in the next analysis step.

Table 1: Cronbach’s Alpha analysis results

Factor	Before analyzing	After analyzing	
	Cronbach’s Alpha	Cronbach’s Alpha	Cronbach’s Alpha
	Number of variables at first	coefficient	Number of variables
Selection	4	0.936	4
Training	6	.926	4 (remove T5, T6)
Job description	4	0.830	3 (remove JD4)
Performance Appraisal	7	0.825	5 (remove PA6, PA7)
Compensation System	5	0.925	4 (remove CS5)
Career Planning	7	0.829	4 (remove CP5, CP6, CP7)
Employee Participation	3	0.764	3
Financial Performance	5	0.817	3 (remove FP4, FP5)

Source: Author’s calculations

After the analysis and evaluation of the reliability of the scales, it is concluded that 41 scales (including variables of dependent and independent factors) are all eligible, except for the T5, T6 (of Training factors), JD4 (of Job description factor), PA6, PA7 (of Performance Appraisal factors), CS5 (of Compensation System factors), CP5, CP6, CP7 (of Career Planning factors), FP4, FP5 (of Financial Performance factors). All of the remaining scales (30 scales) are, therefore, included in the analysis of the following sections.

RESULTS OF EXPLORATORY FACTOR ANALYSIS (EFA)

Exploratory factor analysis of independent variables

All 28 variables belonging to independent factors that satisfied Cronbach’s Alpha reliability analysis are included in the exploratory factor analysis (EFA). The EFA’s mission is to explore the structure of the factors affecting *financial performance* through 7 factors: S (Selection), T (Training), JD (Job description), PA (Performance Appraisal), CS (Compensation System), CP (Career Planning), EP (Employee Participation). After

ensuring proper implementation of the EFA process, these factors will be tested for data cleaning.

Performing the EFA analysis for a total of 28 variables of the independent factors affecting *financial performance*, the study obtains the following results:

Table 2: KMO test of variables with independent factors

KMO		0.643
Bartlett's test of sphericity	Approx. Chi-Square	6720.983
	df	351
	Sig.	0.000

Source: author's calculation

After the factor analysis of variables of independent factors, the paper obtains KMO coefficient = 0.643 with Sig. = 0.000. This result shows the appropriateness of exploratory factor. The Chi-Square statistic of Bartlett's test is 6,720.983 with significant level of 0.000. At the same time, the analysis of variance shows that the average variance extracted reaches 75.038%, this

value is quite high. So it could be said that 75.038% of variation is explained by 7 factors, from which the scales are built and accepted. The stopping point when extracting factors from the seventh factor group with eigenvalue value is 1.361, greater than 1 (which ensures the inclusion of variables of these factors into the following analysis steps. Variables are classified into 7 groups of factors).

Table 3: Rotated Component Matrix

	Component						
	1	2	3	4	5	6	7
S3	0.974						
S4	0.974						
S1	0.974						
S2	0.691						
T3		0.974					
T2		0.969					
T4		0.949					
T1		0.710					
CS3			0.931				
CS4			0.929				
CS2			0.849				
CS1			0.800				
PA3				0.860			
PA4				0.834			
PA2				0.779			
PA1				0.743			
PA5				0.609			
CP3					0.855		
CP2					0.804		
CP4					0.801		
CP1					0.760		
JD3						0.885	
JD2						0.858	
JD1						0.814	
EP1							0.832
EP2							0.778
EP3							0.706

Source: author's calculation

The rotated component matrix results the number of coefficients. They all met the requirements (the factor loadings are greater than 0.5) and are arranged into 7 separate groups of factors, including S (Selection), T (Training), JD (Job description), PA (Performance

Appraisal), CS (Compensation System), CP (Career Planning), EP (Employee Participation).

EFA of Financial Performance:

The scales of financial performance are built to survey financial performance. It included 3 variables FP1, FP2, FP3 which are put into the EFA factor analysis.

Table 4: EFA analysis results

KMO		0.710
Bartlett's test of sphericity	Approx. Chi-Square	268.807
	df	3
	Sig.	0.000

Source: Authors' calculations

The table indicates that the KMO is 0.710. This result shows the appropriateness of exploratory factor. The Chi-Square statistic of Bartlett's test is worth 268.807 with significance = 0.000. The KMO test result, therefore, is proven to be completely statistically significant at the level of 5%.

Along with that, the factor loadings of the component variables FP1, FP2, FP3 are respectively 0.850; 0.883; 0.841 (all greater than 0.5), which implied that the component variables of the factor financial performance are valid for the data analysis.

In general, the EFA of Financial Performance confirms appropriateness of dependent variable so that the paper could perform a regression analysis, in which the factor Financial Performance is assigned as a dependent variable.

$$FP = -0.754 + 0.150*S + 0.205*T + 0.120*JD + 0.078*PA + 0.135*CS + 0.110*CP + 0.350*EP + e_i$$

The most influential factor on the financial performance is the Employee Participation (the beta is 0.350). The higher employee participation is, the better is finance performance (one additional unit of the EP leads to an increase of 0.350 units of the FP). The second large is T (the beta is 0.205). The FP increased 0.205 units for every increase of one unit in the T. The next one is the S factor, then come CS, JD, CP, and PA.

Based on the standardized beta, the level of impact of independent factors on financial performance is given in the following table:

Table 5: Degree of impact of factors

Factor	Level of impact (1- strongest)
Employee participation	1
Training	2
Selection	3
Compensation System	4
Job description	5
Career Planning	6
Performance Appraisal	7

Source: the author's synthesis

It could be seen that, as for Vietnam Joint Stock Commercial Bank for Industry and Trade, the level of impact, in order from high to low is as follows: Employee

REGRESSION ANALYSIS

This regression analysis aimed to determine the degree of influence of independent factors on FP factor (Financial Performance).

The results from linear regression indicate that the total significant value of independent factors is less than 5%, which means that these 7 factors: S (Selection), T (Training), JD (Job description), PA (Performance Appraisal), CS (Compensation System), CP (Career Planning), EP (Employee Participation) significantly affect financial performance.

Consequently, the regression equation (according to the non-standardized coefficient) of the model showing the effects of S (Selection), T (Training), JD (Job description), PA (Performance Appraisal), CS (Compensation System), CP (Career Planning), EP (Employee Participation) is presented as follows:

Participation, Training, Selection, Compensation System, Job description, Career Planning, and Performance Appraisal.

is held, and followed by a statistical process in the shape of a preliminary step towards the analysis.

With the collected database, the author ran the SPSS software to produce information statistics of the surveyed individual subjects as well as performed the main task of analyzing and evaluating the impact of human resource management on the financial performance of Vietnam Joint Stock Commercial Bank for Industry and Trade.

CONCLUSION

Based on the previous research and theories related to analyzing the impact of human resource management on financial performance, the researcher synthesized and proposed a research model including independent factors: S (Selection), T (Training), JD (Job Description), PA (Performance Appraisal), CS (Compensation Scheme), CP (Career Planning), and EP (Employee Participation) while FP (Financial Performance) is the dependent variable.

The paper conducts qualitative research to correct and supplement errors if any and then proceeded to create a survey form and undertook an official investigation to collect opinions of employees at VietinBank's branches. After that, a review of the collected questionnaires to see whether they are appropriate or not

After presenting the fundamental theories about human resources, human resource management and especially domestic and foreign studies in detecting and analyzing influence factors of human resource management on improving financial performance, the researcher proposed 7 main factors of human resource management affecting FP (Financial efficiency), namely: S (Selection), T (Training), JD (Job description), PA

(Performance Appraisal), CS (Compensation System), CP (Career Planning), EP (Employee Participation). The researcher then conducted an analysis to evaluate the reliability of the scales. The results showed that 41 analyzed scales (including the scales of dependent and independent factors) all met the requirements, except for the scales T5, T6 (Training factors), JD4 (Job description factor), PA6 and PA7 (Performance Appraisal factors), CS5 (Compensation System factor), CP5, CP6, CP7 (Career Planning factors), FP4, FP5 (Financial Performance factors). These invalid scales are removed from the next analysis. The results of factor analysis showed that all variables belonging to independent factors met the analysis requirements (the factor loadings are greater than 0.5). The total of 28 component factors are arranged into 7 separate groups of independent variables, namely, S, T, JD, PA, CS, CP, and EP.

The results of the linear regression model showed that all 7 independent variables have positive impacts on financial performance of VietinBank. It means that the effects of independent variables on financial performance of Vietinbank are as expectation.
